FOODVERSE AI

Multimodal Food Intelligence Agent

PROJECT DEMONSTRATION PHASE

1. Demonstration Overview

The Foodverse AI – Multimodal Food Intelligence Agent project was demonstrated through its web interface and backend API. The demonstration focused on showing how a user can interact with the application and how the backend processes a recipe-generation request.

2. Front-End Demonstration

The front end provides the user-facing interface for interacting with Foodverse AI. The application page was opened in a web browser to demonstrate the project interface. The interface is intended to connect user inputs with the backend services.

3. Recipe Generation API

The backend was run using FastAPI and Uvicorn. The recipe-generation endpoint **POST /api/v1/recipes/generate** was used for API testing. A sample request included ingredients such as paneer, spinach, and cherry tomatoes, with a vegetarian restriction and a maximum preparation time of 30 minutes.

4. Backend and AI Integration

The backend project was organized in Python, with dependencies listed in **requirements.txt** and configuration maintained in the project environment. The implementation work included food-related modules and AI-assisted recipe functionality. The API was tested and a successful HTTP 200 response was reported during development.

5. Demonstration Flow

The demonstration followed these steps:

- Open the Foodverse AI application in the browser.
- Show the available user interface and relevant project features.
- Enter sample ingredients and recipe preferences where supported.
- Send a request to the recipe-generation API and observe the response.
- Record the application demonstration for sharing with the evaluator.

6. Tools and Technologies

Programming: Python and JavaScript/JSX **Front end:** React and CSS **Back end:** FastAPI and Uvicorn
Testing: API endpoint testing through the browser/API testing workflow.

7. Demonstration Evidence

A screen recording was created using the Loom screen recorder. The recording can be shared through its generated video link, with access settings configured so the evaluator can view it. The demonstration evidence should be accompanied by the project repository link when required.
